Disease

Gian Piero Pescarmona¹

¹ University of Turin

Disease is the inability of a living organism^[1] to deal with environmental stresses

This is a causal definition of the disease aimed to understand how it developed.

According to this definition every specific disease description should always include all the internal (aging, starvation, genetic) and external (virus, bacteria, trauma, pollution) causes leading to the disease.

Explicit inclusion of all this data in the disease/single patient description would allow a better AI approach to the diagnosis and therapy.
