I had the chance to review the manuscript you submitted to Qeios.

It is definitely an interesting topic, but there is a huge amount of literature already available on the same topic.

Furthermore, anatomical studies are usually based on cadaver dissection and are often submitted along with detailed pictures of the anatomical area that is under assessment.

In this specific case, we have only a very simple drawing that does not give any new information to the reader, and it also lacks 3D depth.

There are also many grammar mistakes, including some misspellings (i.e., posterior communication artery). The paper would benefit from an extensive review.

I do believe this paper does not meet the criteria for publication.

Regards,
