This work resembles a project report for a software application, but it lacks a comprehensive literature review and comparative study. Several critical elements for the reader's perspective are missing:

1. The objective and research gap are not clearly defined.
2. The creation process of the dataset is not explained properly. If the dataset was not created, its source and the number of features should be specified.
3. Figure 1 illustrates feature selection techniques in steps, whereas Section 2.2 describes them as feature reduction techniques. This needs to be clarified for the reader's understanding.
