

# Review of: "Evaluation of Chemical Content and Phytochemical Composition of Yemeni Almond Cultivars"

Daniela De Vita<sup>1</sup>

<sup>1</sup> Sapienza University of Rome

**Potential competing interests:** No potential competing interests to declare.

Overall, the manuscript is not well written.

The grammar needs extensive editing.

The references are not properly cited; most of them are cited using the first name instead of the family name of the first authors.

The scientific name of the botanical species is not complete.

Introduction: The authors state “..having an antioxidant effect for cancer ...” As it is, the sentence is not appropriate (it seems almonds have themselves self-anticancer effect).

Determination of total phenols using the “Folin-Ciocalteu” method must be revised. Four references for Folin-Ciocalteu are not necessary.

It is a well-known method. w/v and v/v must be in italics. It is not clear why Table 5 shows only 2 values for TFC.
