This manuscript was well written in general. It deserves to be published in the relevant journal. I think it will be better for the readers after minor corrections in the study.

My minor comments are listed below:

1. Please remove the human image from Figure 1C,
2. In Fig.3C-D, what is a veterinary skull? If you mean "donkey skull," please change "veterinary" to "donkey."
3. In Fig.4b, I think this graph should be discussed more clearly, referring to the literature. Why was ESD obtained from LAD lower than that of FPD? Also, why does the difference increase with distance? Authors should compare their data to existing literature.
