The study titled "Haematological and Biochemical Patterns in the Liver Function of a Syrup Made From Vitex Doniana Fruit" is commendable. However, there are some suggestions:

1- I suggest that the authors carefully review the **number of groups**. In different parts, different numbers are mentioned.

2- In the **first** line of the results, it is mentioned that "An oral dose of syrup with a concentration between 25 and **100** mg/kg of body weight was given to mice weighing between 25 and 35 grams," but it is written in different places that the dose is given up to 45; please correct it.

3- Please edit the text **grammatically**.

4- Please clearly state the strengths and limitations of the study in the discussion section.
