Potential competing interests: No potential competing interests to declare.

The author claims to be thorough in the experiment carried out, but specification needs to be made to confirm if there was any invasive or non-invasive method used in the study. Since emotion is very complex and very difficult to detect, it requires physiological measuring devices (non-invasive) on the wrist or a simple touch on electrodes that read in emotions such as (eSensor). The author should specify the metrics for detecting the subtle emotions that could be confused for another kind of emotion, like confusing attraction for simple liking or a happy mood. How is the emotion of like and attraction measured? And the author should also specify the latency for detecting a rise in attraction and how to distinguish likeness from attraction.
