

# Review of: "Effects of Cinnamon on Cancer Prevention and Progression"

Oumaima Anachad

**Potential competing interests:** No potential competing interests to declare.

The English language should be thoroughly reviewed throughout the manuscript; I suggest the authors have it read by a professional proofreader. General sentences need to be detailed with citations from recent studies on cinnamon in cancer treatment and prevention. While the explanation of MAPK pathways and cinnamon's effects is good, it could be enhanced by providing more context on the importance of these pathways in cancer biology. The Microbiome and Inflammation sections are well-covered but could be expanded with more recent studies, as the role of the microbiome in cancer prevention is a rapidly evolving field and including the latest research would add significant value.
