Article Review

Feature Selection and Classification of Type II Diabetes on

High Dimensional Dataset (V4IZCT)

1. In this article, we did not find the novelty because the author did not refer to any of the references listed.
2. In the introduction, you should describe the development of previous research that has been carried out by researchers, so that we can find differences between the research you will conduct and previous research.
3. It is best to make the layout in 4 sections, namely:
 - a. **Introduction**, containing a description of previous research related to the topic you are discussing. In this section, state explicitly/implicitly the objectives of this research. In this section, there will be many references to the sources that you use.
 - b. **Preliminaries**, containing descriptions of the concepts (in the form of definitions/theorems/propositions/lemmas) that are needed to support the research topic.
 - c. **Results and Discussion**, containing a description of the results of your research, which is the novelty of your research.
 - d. **Conclusion**, containing a description of the achievements of the research objectives.
4. By dividing sections like that, it will be easier for you to differentiate between the results of the current research and the results of previous research.
