Potential competing interests: No potential competing interests to declare.

The proposal highlights the systemic and holistic perspective of illness and health; however, in the 'reviewer of quantum theory of consciousness and soul,' the concepts are presented as watertight and without examples, extremely summarized and without proper reference. As these are concepts that help the reader to understand the proposal, they are unfortunately vague and unsupported. For example, when it discusses the (definition of negative information), "[...] negative information contributes to challenges and conflict," so challenges and conflict are part of the process of transformations; such analyses only appear in the conclusions, introducing a polarization between negative and positive information. The mathematical 'definition of life' also reflects this closed and watertight concept when it does not identify the ability to use negative information and turn it into something positive. Perhaps this was due to the synthetic way in which the concept was presented.

Now, if the perspective is holistic and systemic, in the first part of the text, these paradigms are not evidenced, especially when it comes to the 'causes of soul sickness.' Furthermore, one of the aims is to demonstrate that there are strategies, techniques, and research that use instruments for change. In addition, there are various interventions that employ drawing, writing, dreaming, and are widely used in therapy aimed to promote healing that would support the study proposal. The presentation of the first part in a dialogical way, as was done from item 5, 'soul and sickness,' would be excellent.
