Potential competing interests: No potential competing interests to declare.

It seems like you're discussing a scientific study or research paper related to Giardia detection. You're making some valid points:

1. Age as a risk factor: Yes, age can be an important factor in Giardia infections, and it's important to consider it in studies.
2. Prevalence and sample size: You're right that the sample size may not be representative of the whole population, which can affect the accuracy of prevalence estimates.
3. PCR detection: Polymerase chain reaction (PCR) is a sensitive and specific method for detecting Giardia species, and it can provide more scientific insights than other methods.

Giardia is a common intestinal parasite that can cause diarrhea, weight loss, and other gastrointestinal symptoms. It's important to have accurate and sensitive detection methods to diagnose and study Giardia infections.
