

Review of: "Seismic intensity measure selection considering Record-to-Record and Angle-to-Angle uncertainties."

Ju Qiu

Potential competing interests: No potential competing interests to declare.

First, the uncertainties, such as the random distribution of (R-TO-R) and (A-TO-A), are so poorly studied that there is almost no quantifiable outcome data available. Second, the case study is very vague, describing two three-story and nine-story steel structures without any pictorial representation. Third, the manuscript lacks a clear introduction to the methods used, whether they were adopted from previous studies or developed by the authors themselves. As a result, the entire article lacks a clear analysis of the process, corresponding conclusions, and notable contributions.

The suggestion is to include substantial additional content before publication.
