Potential competing interests: No potential competing interests to declare.

Several factors to take into account:

- 1- The text should provide clearer information that the raw lisado was the initial source of DNA and that a different extraction method was employed subsequent to boiling.
- 2- In table 1, I recommend revising the format. The initial sequences lack any connection to a specific target gene and do not provide any references or information regarding the size of the amplicons. I recommend aligning each target gene more explicitly, including its corresponding base pairs and the size of the amplicon.
- 3-- Figure 1 was not available.
- 4- I propose displaying a picture illustrating the sensitivity of PCR. The data is referenced in the summary but not displayed.
- 5- In the methodology, substitute the term "Eppendorf" with "microtube".
