Reviewer's comments

I read the article in detail. It discussed the LFT abnormalities in liver disease patients in Ethiopia. I have a few comments.

1. The objective of the study is not clear. There is nothing naïve.
2. Authors never mentioned any value of any variable in their study. No statistical representation was made for any variable.

There are many deficits in the study. In the present form, I do not agree with the authors' rationale for the study. It is very difficult to tell all things starting from baseline.
