Potential competing interests: No potential competing interests to declare.

1. Please include a map showing the location of the study area.
2. The abstract requires improvement by adding more explanation regarding the purpose of the study, methods, and results. It should be more informative.
3. The methods explained in the Introduction part make it confusing. In the introduction, the topic, problem statement, and research gaps should be explained more in detail. The methodology was not clearly stated. The authors have to tune it up, especially on the methodology, significance of the study, and the discussion of the results.
4. Also, the author should provide a section for a literature review and discuss more works related to the given task.
5. The conclusion does not provide any directions for future studies.
6. Overall, it is a very interesting paper that I would like to suggest for publication, but definitely not in its current form.
