This is an interesting study. This study used the data of Chinese invention patents from 1985 to 2017, and used SNA and ESDA methods to analyze the structural characteristics and proximity comparison of urban innovation cooperation network in China. The structure of this paper is complete and clear, the application of research methods is relatively proficient, and its research objectives have a certain degree of theoretical value. But there is a question, what kind of connection and difference exist between structural characteristics and proximity comparison of urban innovation cooperation network? I feel that the two parts are juxtaposed, the first analysis is the structural characteristics, and the latter is the spatial characteristics.
