**Potential competing interests:** No potential competing interests to declare.

This article cannot be published in the current form as it contains a lot of grammatical mistakes. For example, PET is written as polypropylene terephthalate. The introduction requires more in-depth analysis of the literature, which is missing in the current form. The novelty of the article is missing. The manufacturing technique is vague, as it does not describe what technique is applied to mix the ingredients, neither the conditions at which the mix was prepared. Additionally, the results do not guarantee the significance of the investigation, since apart from compressive strength, there are lots of properties that should be discussed in the paper, which are equally important for the feasibility of the study.
