**Potential competing interests:** No potential competing interests to declare.

## **Summary and overall evaluation:**

As stated in the abstract, this article is a review of the main ideas provided for the control of vector-borne diseases in Indonesia, highlighting the importance of taking into account the three axes involved: humans, animals, and the environment. The ideas presented revolve around the proposal called One Health and ways to strengthen it.

The article is very well written and very well documented with research work done in the territory of Indonesia, but which could very well be extrapolated to other tropical territories with similar needs, which is why I consider it worthy of publication.
