Potential competing interests: No potential competing interests to declare.

The title clearly describes the research undertaking in the study.

Introduction: There isn't enough information about the plant mentioned in the research, its common names, and where it is grown.

Methods:

1. The method of extracting the plant, how to prepare potions, and what the components of the juice are were not mentioned.
2. The number of groups is not specific, as it is mentioned as 6 and 7 at different places.

Results and Discussion

The discussion provides a good interpretation of the results but should link findings more explicitly to the existing literature. There is a need for a clearer explanation of how the results support or contradict previous studies.

Wish you all the best, and thank you for sending me the research for evaluation.
