Acral persistent papular mucinosis

INSERM

Source

INSERM. (1999). *Orphanet: an online rare disease and orphan drug data base. Acral persistent papular mucinosis. ORPHA:90396*

Acral persistent papular mucinosis is a rare chronic form of localized lichen myxedematosus (see this term) characterized by the development of multiple symmetrical skin-colored mucinous papules exclusively on the extensor surface of the hands and distal forearms.
