Review

of paper entitled 'On the vapour pressure over three-component solutions' by Alexander Levinsky

Here are some remarks about the present version of the manuscript:

1. Title: too general, it suggests that we get a solution by raising the problem.
2. I recommend that you also indicate the SI unit of parameters when writing the nomenclature!
3. The content of the manuscript is less than 4 pages.
4. The manuscript does not include the division typical of scientific works (Introduction, Literature review, Results and discussion, Conclusion).
5. The work is incomplete and has no usable results in technical life.
6. I suggest to complete the calculation and show the results. The end of the manuscript is uncompleted.
7. I suggest to create a result capture.

Conclusion: Reject, the paper can't be published in 'Qeios'.
