Potential competing interests: No potential competing interests to declare.

Authors have linked many aspects of Candida hyphae with some disease or another, which is good as a hypothesis. Authors have stated that Candida overgrowth is primarily related to increased carbohydrate/sugar levels in the body. The authors' approach is entirely conceptual and hypothetical until proven by evidence. This must be emphasized at the start of the manuscript, i.e., in the introduction, rather than at the end. Also, the title must include the word "hypothesis" in it, e.g., "Hyphae and Healthspan: A Hypothesis" or "Candida Hyphae and Health: A Conceptual Approach."
