List of comments for articles with the title: The Relationship Between Attitudes Toward Classroom Learning and Attitudes Toward Digital Classroom Learning

* In the Abstract subsection:

- a. Authors should state the research methods used (explicitly) in the Abstract subsection.
- b. Generally, the description in the Abstract subsection is presented in the same paragraph (one paragraph). Please revise or make your abstract description in one paragraph.

* In the Introduction subsection:

- a) The citation used to explain the background to the need for this research to be conducted (in the Introduction subsection) must come from the latest publication (no more than 5 years old). Note: Replace all references/citations that are over 10 years old and above that strengthen your research background because they are no longer suitable for use as references.
- (b) Authors must show that this work differs from previous related works by comparing it to prior works. Thus, the authors indicate the research's novelty and do not duplicate previous research (or have never been studied before).
- (d) At the end of the Introduction subsection, the authors should mention the systematic sequence or organization of the next subsections of the discussion in this manuscript.

* In the Method subsection

- (a) Please add a research methodology flow/block diagram to show the research's sequence or process.
- (b) Your research must explain whether it uses population or sample data. If it uses sample data, you must also describe the sampling technique and significance level.
- (c) It is better to present the explanation in paragraph text and not in an item-by-item presentation.

* In the Result subsection

- (a) You must include the results of reliability tests on the instruments you use in the research.

(b) It must be clear what the score is for each attitude being measured and what the relationship is between the attitudes being measured.

*** In the Discussion subsection**

The Discussion subtitle should focus on research findings. It would be even better if the findings were correlated as discoveries (novelty), reinforcement of previous research, or agreement with the findings of previous research.

*** In the Conclusion and Future Works subsection**

Your manuscript must include a Conclusion subsection that discusses the research results' findings, novelties, and weaknesses.

*** In the Reference subheading**

References cited should be under 5 years old, so it is best to replace references that are over 15 years old with the most recent scientific articles.
