Potential competing interests: No potential competing interests to declare.

The present research work is definitely good and important in the present scenario. The abstract is good and well explains the entire work. The introduction has all previous work references and inputs needed for the present work, as well as the need for the work. Methods and data analysis are adequate, and formulas are well applied to get constructive results. Results are appropriate. The spatial distribution map of aboveground carbon is good and appropriate.

Discussions are very suitable for the present study. Conclusions and recommendations are appropriate in concurrence with the results of the present study. References are appropriate.
