Potential competing interests: No potential competing interests to declare.

- The study explores the economic impact of mobile money in Somalia, a post-conflict setting, which adds to the existing literature on financial technologies in developing economies.
- The use of secondary data and the ARDL approach ensures a reliable and quantitative analysis of the impact of mobile money on the economy.
- The study's findings might be specific to Somalia's context and may not be entirely applicable to other countries or regions. Additionally, the study relies on existing data, which may have limitations in terms of accuracy, completeness, or relevance.
- I would suggest that the study could be replicated in other developing economies or post-conflict settings to further validate the findings and increase generalization.
- Furthermore, a qualitative study could be conducted to gain a deeper understanding of the mechanisms by which mobile money influences economic activities and growth.
