Thanks to the author for this systematic review in one of the world's wide pandemic viral infections.

1- What were the causes of long COVID symptoms? I mean, why did you not study the different ways of management in different areas which may contribute to the persistence of symptoms?

2- Where were the studies from different regions of the world, such as Africa, which may add strong conclusions?

3-Did the long symptoms relate to patients with other comorbidities such as HTN, DM, IHD, and pulmonary disorders?

4- What was the severity of the primary COVID infection, and is it related to the persistence of the symptoms?

5-All the references should be written in the same style as Ref. (3), revise (Ref., 10, 11, 15, 20, 25, 26, and 27).

6-Including studies from different regions like Africa could strengthen the conclusions. By increasing the sample size of the study group, study whether the climate conditions and socioeconomic differences have a role in symptoms severity and persistence.
