Dear Editor,

Basic information is good.

Data on reproductive biology is very limited, with sex ratio, GSI, and first maturity

Could you include egg size and correlate it with months? It is an important parameter to understand the spawning season.

If possible, add some pics of maturation stages.

For males, use "milt" instead of "spawning."

GSI: The formula should be checked; it has additional x.

Overall, the manuscript is sensible.

Thanks

Regards
