A Novel One-Pot Three-Component Approach to Orthoaminocarbonitrile Tetrahydronaphthalenes Using Triethylamine (Et₃N) as a Highly Efficient and Homogeneous Catalyst Under Mild Conditions and Investigating Its Anti-cancer Properties Through Molecular Docking Studies and Calculations

Review report

You need to perform different spectroscopic analyses to prove the new compounds (13C NMR, Mass, and IR) because they depend only on 1H NMR to prove the new structures

The docking study is not clear; they need to repeat it more perfectly.
