A well-written review article, easy to understand, explained the various perspectives of e-learning. It covers various subjects, including science and engineering, which is very interesting. Not surprisingly, although engineering has been the subject of 471 articles, it only involved the engineering concepts, as engineering subjects require both theory and practical application. However, the computer and social sciences, technological progress, and educational theory and practice were well explained. The strength of the review is the extensive screening and selection process as part of the methodology used.
