Potential competing interests: No potential competing interests to declare.

The manuscript lacks a number of data typically required for a research article. For instance, there is no description in the methodology of the qualification procedure adopted for ethanol, how the cellulases were procured for the hydrolysis process, and moreover, the authors failed to compare their work with the results of previously published articles.

Also, the novelty of the work needs to be highlighted in the introduction section. I think Tables 1 and 2 are redundant. Since the product produced is bioethanol, why is it required to carry out such studies?

Overall, the manuscript does not present anything novel, and the data presented and the discussions made out of that are not conforming to publication standards.
