

Review of: "The Effects of Polypropylene Wastes on the Compressive Strength of Grade 25 Concrete"

Narayanasamy Gurumoorthy

Potential competing interests: No potential competing interests to declare.

- This looks like an undergrad summer project. It does not have any in-depth research. Overall, the preparation of this version is too low quality.
- More explanations for the experimental test results are needed. Results and discussion must improve.
- Conclusions drawn from the study should be precisely written.
- I recommend the authors edit and resubmit again. Further, it is just a report, NOT a research paper; the authors should add valuable discussion.

After reviewing this manuscript, I recommend it can be accepted after major revision; such a revised manuscript may be considered for publication after re-review.
