

Review of: "Acceptance of Childhood Rotavirus Vaccine Among Mothers at The Point of Rotavirus Vaccine Introduction: A case study from Awka Anambra State Nigeria"

Adilson Fernando Loforte Bauhofer

Potential competing interests: No potential competing interests to declare.

I suggest a clear description of the dependent variable/outcome of interest. In the title and introduction, the authors indicate that i) acceptance of the childhood Rotavirus vaccine is the dependent variable; however, the sample size was estimated considering the ii) awareness of Rotavirus prevalence, which is later presented in the results.

The resident doctors who conducted the interviews—are they also the health workers providing care for the antenatal care and immunization services? If so, a conflict of interest is presented. How did the study staff ensure that participation was not coerced?
