Potential competing interests: No potential competing interests to declare.

This is an interesting effort to relate the mega events to urban resilience. However, authors should come with some quantitative outputs, for example, they should explain how much a mega event can impact the social and economic aspects of an urban area. They should also indicate the size of an urban area with an indicator such as urban population. Indeed, they should also introduce a definition of a mega city, e.g., a city with a population of 3 million and above. Another aspect when we are discussing urban resilience is to find out whether a city is ready in terms of infrastructures such as energy, water,.....etc. I believe authors should discuss these issues too.....
