**Potential competing interests:** No potential competing interests to declare.

This speculative framework offers a profound reinterpretation of existence, suggesting that it is a strategic manifestation of the universe. This perspective invites us to view the "living and non-living" not as distinct categories but as interconnected tactics employed by the universe. By framing existence in this way, we are encouraged to think of life and non-life as part of a continuous spectrum rather than separate entities.

The first speculation proposes that existence is a strategy, with life and non-life coexisting simultaneously. This idea challenges the traditional dichotomy and opens up possibilities for understanding how different states of matter and energy interact within the universe. It implies a unified framework where the distinction between life and non-life is more fluid and dynamic.

The second speculation suggests that consciousness pervades life from one extreme to the other. This notion expands our understanding of consciousness beyond human experience, potentially encompassing all forms of life and perhaps even non-living entities. It aligns with certain philosophical and scientific perspectives that see consciousness as a fundamental aspect of the universe.

Finally, the third speculation asserts that we are simultaneously alive and dead, yet we experience life for practical reasons. This paradoxical idea resonates with certain interpretations of quantum mechanics, where particles can exist in multiple states simultaneously. It also touches on existential and philosophical themes about the nature of life, death, and perception.

Together, these speculations invite a rethinking of our place in the universe, encouraging us to explore the interconnectedness of all things and the deeper nature of existence. They offer a fertile ground for further philosophical, scientific, and existential inquiry, potentially leading to new insights into the fabric of reality.
