

# Review of: "Seismic intensity measure selection considering Record-to-Record and Angle-to-Angle uncertainties."

Paulo de Souza Tavares Miranda

**Potential competing interests:** No potential competing interests to declare.

"Seismic intensity measure selection considering Record-to-Record and Angle-to-Angle uncertainties" is an important topic in earthquake engineering and structural analysis, once, considering both makes the seismic risk assessment more accurate.

In order to be published, I suggest improvements both from a conceptual point of view, seeking more references in the state of the art and using this information to justify the importance of continuing studies on the subject; as well as from a grammatical and formatting point of view with regard to the distribution and presentation of the subjects.
