Potential competing interests: No potential competing interests to declare.

To improve the attractiveness of work, I recommend the following:

The term "concrete" should be expanded by a new term, e.g., artificial, improved, etc., since sand is a mineral and polypropylene is a completely different group of materials.

Image no. 1 is poorly readable; I recommend its redesign.

The experimental part lacks a description of the production of the samples, the mixing of the used particles, and data such as the size and shape of the samples.

Image no. 2 is little discussed. I recommend the expansion of the conclusions as well.
