I am not yet very familiar with the procedures of this magazine; therefore, I will not express judgments on the article's merit. I will limit myself only to making observations aimed at improving the article.

In the data collection, please indicate how many samplings were taken from January to December 2019. The 3 different sites used for sampling seem to be very far from each other. Checking whether there are differences in the data for the three different locations is an important indication to provide to the reader. An ANOVA between the three groups by month of sampling would be a first step. Furthermore, I would recalculate the GSI values for each month and per site.

The Sigmoid Formula is wrong; the initial parenthesis is missing from the denominator. Please change it.

Have a nice day!
