Potential competing interests: No potential competing interests to declare.

The paper is commendable, but requires some restructuring in the methodology section. Specifically, the study area needs to be reorganized, and a concise explanation of the site should be added. If the authors haven't obtained proper research consent, it's crucial to protect participants' identities by blurring their faces in any images. This step ensures ethical research practices and maintains participant confidentiality. Overall, these minor adjustments will enhance the paper's clarity and organization, particularly in the methodology. Addressing these points will strengthen the research presentation while adhering to ethical guidelines, ultimately improving the quality and professionalism of the paper.
