**Potential competing interests:** No potential competing interests to declare.

This article is contemporary because it uses medical, societal, and opinion-based evidence to create an idea about planet colonization by one individual and funder.

Entirely, from Introduction to Conclusion, the remarks were based on personal views. No form of validation or calibration was included, and the examples were from a single nation instead of having out-group comparables.

Based on these examples, it is preferred to communicate a short communication or opinion article rather than a scientific one. Hence, based on conflicting contents, it is best to reduce the article length, remove some pictures, and change the article form to a simpler, straightforward version. Hence, a submission type change is suggested.

It would be good to be precise and concise in providing examples, then include every aspect of the example to make an idea for the contents. The author must be aware the contents are not scientific but opinion-based. The data could not be analyzed.
