The topic of the paper is good. However, I would appreciate if authors inserted a clear statistical analysis for ALL the studied traits within the manuscript and tried to further boost and improve the readability of all the sections.

The following sentence at the end of the abstract should be modified: 'It is concluded from the study that Yemeni almonds are characterized by unique properties that promise multiple uses in the food and pharmaceutical industries and in the prevention and treatment of many diseases.' Since no data related to possible disease treatment is presented within the present work,

Authors should change the title of Figure 1

The conclusion should open new horizons for future works based on the gathered and analyzed data within this work.
