Potential competing interests: No potential competing interests to declare.

I did not find any novelty in the study. It is just like data collection at various sites. Data collection cannot be considered as a complete study. A reasonable analysis that leads to novel outputs can be considered as good research. This research will be complete when authors try to provide more valuable information based on the data collected. Authors can use techniques like source apportionment to find out the source regions that are responsible for the elevated pollution levels. As the data collected is good, authors can also perform prediction studies using newly available techniques like ANN.
