Potential competing interests: No potential competing interests to declare.

English grammar check is required throughout the document.

Materials and methods: Improperly mentioned study setting (remove sociodemographic variables), describe the details of strata. Mention the type of study design and type of consent. Statistical analysis: Descriptive statistics are enough; remove mean, frequencies....., SPSS version??

Results: Detail the percentiles, avoid duplicacy in text and tables. The description of reading level and math level assessment is missing. Multivariate analysis is not present in the statistical analysis; kindly include. At what level of significance the results were assessed is nowhere mentioned. In Figures 1, 2, 3, what do the multicolored boxes represent 1, 2, 3, 4, 5? Description of the colored boxes should be done in the captions of every figure.

Discussion: The results can be discussed in an elaborative manner, highlighting the key points. Findings and comparison with other recent international studies should be included. It is suggested to describe the nutritional status of the study comprehensively along with the socio-economic status.

Conclusion: Rewrite the conclusion. It should not contain the general results; instead, it should contain the key findings.

Major modifications are required in the methodology, results, and discussion sections.
