Potential competing interests: No potential competing interests to declare.

> Title

- The title, "A Rare Case of Carcinoma Erysipeloides After TNBC Mastectomy: Challenges in Diagnosis and Implications for Treatment," adequately reflects what was discussed in the manuscript.

> Authors and Affiliations

- The authors of this manuscript are Amr Ahmed from the Public Health Department and Maher M. Akl from the Chemistry Department. Their affiliations are closely related to the topic, making the study entirely credible.

> Abstract

- The abstract correctly outlines the critical points of the article, portraying the rarity and diagnostic dilemmas of Carcinoma erysipeloïdes (CE) in triple-negative breast cancer (TNBC) patients.

- Provides concise insight into the case and underscores the need for biopsy and dermatological evaluation in the diagnosis and management of CE.

> Introduction

- Introduction to CE, its pathophysiology, and the difficulties in its diagnosis, especially in patients with TNBC, are set at the outset.

- Increases the reader's expectation significantly for the case study, which is to follow.

> Materials and Methods

- The methods section, though brief, has given copious detail to the case study, which included the case history, treatment given, and diagnostic procedures.

> Results

- This section represents the findings of the case study on the importance of performing biopsy in the diagnosis of CE.

- Figures and images make it more understandable how difficult CE is to diagnose.

> Conclusion

- It is concluded very well with the critical points of the article, all of which infer that a high index of suspicion warrants heightened surveillance, dermatological evaluation, and biopsy in the diagnosis and management of CE.

- There are practical recommendations for relevant clinical practice.

> **Figures and Tables**

- The figures and images are well-labelled and presented to shed light on the progression of CE and its diagnostic difficulties.
- They were also incorporated appropriately for the backings, at the same time keeping the readers in a visual perspective of the issue at hand.

> **References**

- The references provided are timely and pertinent, thus creating a suitable ground for the research.
- The references are correctly presented and cited in the text.

> **Overall Evaluation**

- In general, the body of the article is tight in structure and well written. Comprehensible the context in which the same applies allows one to recognize the worth of making diagnoses and administering treatments for the issue at hand, the carcinoma erysipeloides in patients with triple-negative breast cancer.
