Excellent paper containing the origin of chronic inflammatory Covid caused by protein S that leads to the worsening of several diseases that the patient already has or that has the genetic potential to develop a new pathology. The paper shows us control and curative therapies that are probably very effective because they have an anti-inflammatory effect on the intestinal mucosa that improves the absorption of nutrients by the intestine, increasing immunity and general homeostasis of the human body. All of this leads to recovery and improved quality of life for the patient.
