**Potential competing interests:** No potential competing interests to declare.

This study provides a detailed report on the product of a specific region and offers valuable insights for local agricultural practices, but it does not present the level of innovation that would possess considerable merit in terms of its practical application and relevance to regional stakeholders, particularly local farmers. The comprehensive data and region-specific information you have compiled is of significant value to those directly involved in the agricultural sector of the area in question.

I believe it would be more suitably published in a national or regional journal where the primary audience would benefit the most from your findings. Such a platform would ensure that the information reaches the intended beneficiaries, thereby maximizing its impact and utility.
