

# Review of: "Stock Estimation Trial From Spatio-temporal Limited Data of Six Commercial Species in the Middle Madeira River, Southwest Amazon"

Nathan Mrombo

**Potential competing interests:** No potential competing interests to declare.

By analyzing the catchability and potential overexploitation of key commercial species, this research makes a substantial advance to our understanding of the sustainability of fish stocks in the inland waters of the Amazon. Nevertheless, it would be beneficial for the study to have a more thorough examination of seasonality, environmental variability, and the effects of various fishing techniques and equipment on catchability. Addressing these aspects in future studies will enhance the robustness and applicability of the findings. Overall, the report provides a strong basis for future research to create sustainable fishing methods and conservation plans in the Amazon area.
