Potential competing interests: No potential competing interests to declare.

The topic of this review article is too grand. Each part is not comprehensive and in-depth. As a result, there are no targeted and systematic summaries that present valuable conclusions and guidance. This loses the point of writing a review. Thus, I cannot recommend it for publication. The authors are suggested to summarize the literature in a certain application field of nanoparticles, such as catalysis, energy, environment, biology, or medicine, to put forward some valuable findings.
