Respected author,

The article provided an overview of what UAVs can do and how the agriculture domain might benefit from them. The structure of the article looks good. I have a few queries:

1. Is it a review paper or a work paper?
2. Be specific about the method that is being presented in the work. Is it the author's or existing?
3. Are the authors comparing their work with others, or are they presenting a comparative study?
4. The article focused on various diseases affecting various plants, and the conclusion talks about paddy plants alone. Need clarity there.
5. If it's only about paddy, how the model is trained has to be discussed, or it's only about imaging the crops. If so, the author could detail the cost effectiveness and how farmers can come to a conclusion about the disease type.
6. Is there a threshold the author uses to categorise the disease type, extent of the disease, or the amount of pesticide needed?
7. These are a few of my queries, and I would be happy if they were clarified.
8. Thanks and regards,
